1.0 Introduction

The Michigan Department of Environment, Great Lakes and Energy (EGLE) has prepared this Quality Assurance Project Plan (QAPP) for sampling to investigate sources of elevated per/polyfluoroalkyl substances (PFAS), specifically perfluorooctane sulfonic acid (PFOS), previously measured in fish and surface water samples collected from Pere Marquette Lake in Ludington, Michigan. Occidental Chem Corp (1600 South Madison Street, Ludington, Michigan), a direct discharger located along the eastern shore of Pere Marquette Lake, has been identified as a potential source of PFAS to this surface water body. Additionally, surface water samples will be collected from the Mosquito Creek to assess the impact of known contaminated groundwater to surface water as part of a separate compliance action.

Water samples will be collected from surface waters, outfalls, upstream composite sampler, and lagoons.

This QAPP includes information on the following:

- 2.0 Project Organization and Responsibility
- 3.0 Project Objectives
- 4.0 Sampling Procedures
- 5.0 Sample Custody
- 6.0 Quality Assurance Objectives for Measurement
- 7.0 Cost Estimate
- 8.0 Health and Safety Plan

In the following pages, we have outlined our approach for each of the above listed components.

2.0 Project Organization and Responsibility

Sampling of the surface waters, outfalls, and lagoons will be completed by staff in the Water Resources Division (WRD) Emerging Pollutants Section, Field Operations Section, and Cadillac District Office during the first week of March 2025. The analysis of samples for select PFAS compounds will be performed by the EGLE Environmental Laboratory, as detailed in **Section 4.5**.

2.1 Training and Certifications

There is no special training or certification required of the EGLE, WRD staff to perform this sampling.

3.0 Project Objectives

The objective of this sampling plan is to investigate a potential source of PFAS that was identified at elevated concentrations in fish and surface waters of the Pere Marquette Lake. There is a known exceedance of the Rule 57 Water Quality Value for PFOS in the surface waters of the lake, as well as detections of PFOS in fish as high as 294.05 parts per billion (ppb).

4.0 Sampling Procedures

Sample locations, types of samples collected, analyses to be performed, and rationale was determined to meet the project objectives.

4.1 Sampling Locations, Type, and Schedule

Grab samples of ambient surface water will be collected at four locations in Pere Marquette Lake; two wastewater samples will be collected from the South Pond Lagoon; one sample will be collected from the facility's composite sampler location prior to combination with stormwater; and one sample will be collected from the discharge from outfall 001; and three samples will be collected from Mosquito Creek (**Table 1, Appendix II**). Additional surface water or stormwater samples may be collected based upon visual observations made on-site at the time of sampling.

One field replicate, field duplicate, and field blank sample will be collected for PFAS, as specified in **Table 1**. Depending on site conditions, the location of the replicate samples may change. An equipment blank will be prepared if water sampling equipment (e.g., sampling pole) is used and field staff believe there is a potential for cross-contamination to occur.

4.2 Sampling Techniques

4.2.1 PFAS. Because PFAS are present in a wide variety of consumer products, steps will be taken to reduce the risk of cross-contamination. Field staff will take practical and appropriate precautions to avoid items that are likely to contain PFAS at the sampling site as well as avoid specific items the day of sample collection following EGLE's PFAS Sampling Guidance documents presented in **Appendix III**. All sampling equipment will be cleaned using Alconox® or Liquinox® soap (where appropriate) and triple-rinsed with deionized water prior to initial use and triple-rinsed with deionized water and stored in polyethylene bags between sampling locations. All personnel handling sample bottles will use powderless nitrile gloved hands. Gloves will be replaced after each sample collection at each location and when staff believe the gloves may have been contaminated.

Each sample will consist of two filled 250 mL high-density polyethylene (HDPE) bottles (PFAS-free bottles to be provided by the lab). Care should be taken during sample collection to avoid collecting surface scums.

In wadable stream reaches, samples will be collected by hand by dipping bottles into the stream approximately 6 inches below the water surface, upstream of any sampling equipment and personnel; otherwise, samples will be collected from the edge of the stream or above a bridge/culvert using a dip pole. Samples should be collected at a point where the flow is determined to be the greatest, with samples being taken simultaneously, if possible. All personnel handling sample bottles or equipment will use gloved hands. Gloves will be replaced after each sample collection at each location.

A field blank is used to determine the effect of sample exposure to ambient on-site conditions, collection methods, and possible contamination during transit and at the laboratory. A field blank for PFAS will be collected at one selected sampling site by filling one sample bottle with deionized, PFAS-free water provided by the lab.

Field replicate samples are co-located samples collected to provide an estimate of contaminant variability in the stream. A set of replicate samples will be collected for PFAS at one replicate site (4 bottles per site) by the same person from the same stream location and using the same sampling method as a normal sample.

An equipment blank will be prepared for each type of equipment used (e.g., chlorophyll sampler) by filling the equipment with deionized water and then pouring the water into the sample container. The deionized water used for equipment blanks has been found to be PFAS-free.

4.3 Sample Preservation

No preservatives will be added to any of the sample bottles, since they are not required. Once collected, all samples will immediately be placed on wet ice (in a re-sealable low-density polyethylene (LDPE) bag) in plastic coolers. Samples will be kept on ice then repacked in ice until they are overnight shipped to/dropped off at the EGLE Environmental Laboratory.

4.4 QC Sample Collection

Field Staff should complete a documented review of 100 percent of the field data for compliance with QC requirements. Specific requirements are outlined below. Field QC sample results are reported with the data report.

Equipment Blanks – Equipment blanks will be collected by pouring laboratory PFAS-free water over the decontaminated sampling equipment and collecting the rinsate into the appropriate sample containers. Equipment blanks will not be collected when dedicated sampling equipment is used (e.g., peristaltic pump with dedicated tubing or dedicate stainless steel tools for the program).

Field Blanks – A field blank is a sample of reagent water poured into a sample bottle. It is collected in the same type of container as the environmental sample, preserved in the same manner, and analyzed for the same parameter. These blanks document the potential for cross-contamination of the samplers and the sampling methods.

Field Replicates – A field replicate is defined as a second sample (or measurement) from the same location, collected in immediate succession, and using identical techniques. Replicate samples are sealed, handled, stored, shipped, and analyzed in the same manner as the primary sample. Precision of replicate results is calculated by the relative percent deviation (RPD) as defined by 100 times the difference (range) of each replicate set, divided by the average value (mean) of the set.

4.5 Sample Analysis

All samples will be delivered to the EGLE Environmental Laboratory for analysis. The EGLE Environmental Laboratory will perform PFAS analysis via the United States Environmental Protection Agency (USEPA) Method 1633 for all 40 identified PFAS analytes.

The samples will be analyzed for the 40 PFAS compounds identified in EGLE's Laboratory Analyte List as presented in **Appendix I**.

5.0 Sample Custody

5.1 Sample Containers, Preservation, and Holding Times

Sample bottles and chemical preservatives will be provided by the laboratory. The containers will be cleaned by the manufacturer to meet or exceed all analyte specifications established in

the latest USEPA's Specifications and Guidance for Contaminant-Free Sample Containers. A summary of sample container, preservation, and holding time requirements is presented in **Table 3**.

5.2 Sample Labeling

Immediately upon collection, each sample will be labeled as described in the sections below in **Section 5.5**. Samples will be assigned unique sample identifications. Each sample label will include the sample number and date/time of collection.

5.3 Chain of Custody

Proper sample handling and custody procedures ensure the custody and integrity of samples beginning at the time of sampling and continue through transport, sample receipt, preparation, and analysis. The WRD's procedure WB-004, Chain of Custody (COC), dated December 1, 2005, will be followed in the field. The list of items below should be included on the COC form:

1. Date and time of collection
2. Site identification
3. Sample matrix
4. Number of containers
5. Preservative used
6. Analyses required
7. Name of collector
8. Custody transfer signatures, and dates and time of transfer
9. Name of laboratory admitting the sample

A sample is in custody if it is in actual physical possession or in a secured area that is restricted to authorized personnel. The COC form is used to document sample handling during transfer from the field to the laboratory and among contractors.

COC forms from the EGLE Environmental Laboratory will be used for this project.

5.4 Failures in Chain of Custody and Corrective Actions

All failures associated with COC procedures are immediately reported to the Manager/Supervisor. These include such items as delays in transfer (resulting in holding time violations); violations of sample preservation requirements; incomplete documentation, including signatures; possible tampering of samples, broken or spilled samples, etc. The Manager/Supervisor will determine if the procedure violation may have compromised the validity of the resulting data. Any failures that have a reasonable potential to compromise data validity will invalidate the data and the sampling event should be repeated, or if unaffected the second sample shall be analyzed by the EGLE Environmental Laboratory. The resolution of the situation will be reported to the Manager/Supervisor and corrective action reports will be maintained by staff.

5.5 Sample Designation

All sample bottles will be labeled with permanent ink or Sharpie marker or immediately upon collection, each sample will be labeled with an adhesive label. Information on the sample bottle label must include the site number (**Table 1**) and include the date and time of sampling. The COC form that accompanies the samples must contain all this information.

5.5.1 Sample Identification

Sample IDs will all be identified by the corresponding site ID found in **Table 1** and **Figure 2**.

Field Replicate: “FR” will follow the sample ID (e.g., OcChem-OF1-FR).

Field Duplicate: “FD” will follow the sample ID (e.g., OcChem-OF1-FD).

Equipment Blank: “EB”. If multiple EBs are collected on the same day for differing types of sampling equipment, numerical designations will be used to differentiate the type of equipment blank (e.g., EB01, EB02), with the type of sampling equipment associated with each type of equipment blank documented in the field notes (e.g., EB01 collected from tubing, EB02 collected from sampling screen).

Field Reagent Blank: “FB” followed by sampler’s initials (e.g., FB-AM).

6.0 Quality Assurance Objectives for Measurement

A mixture of laboratory and field variables may affect data quality. The variables include sample matrix variability, sample collection/handling procedures and equipment, sample analysis techniques, and recordkeeping. To control these variables, the Data Quality Objective (DQO) process is used. DQOs developed for this project specify discrete parameters in six areas: Precision, Accuracy, Representativeness, Comparability, Completeness, and Sensitivity (PARCCS). A brief description of each of these parameters is presented below, along with the formulas for calculation of precision, accuracy, and completeness for the scheduled analyses.

Precision and completeness are expressed and evaluated quantitatively. Representativeness, accuracy, comparability, and sensitivity are more subjective in nature and are addressed in both quantitative and qualitative terms. The primary QA objective is to measure the quantity of target analytes in each sample without unacceptable bias.

Data quality objectives for the analytical results are presented in **Table 2**.

6.1 Precision

Precision is determined as a measurement of the closeness of individual test results under prescribed conditions, and reflects a combination of random and systematic error, as well as natural variation within a specific matrix. Only data generated within the required precision criteria will be deemed usable. However, the Laboratory Supervisors, prior to rejecting data as unusable, will closely evaluate the data for potential matrix interference and its effects on the results.

The precision of measured data is affected by natural variability in the sampling matrix, as well as laboratory and sampling factors. Laboratory precision will be assessed through the analysis of laboratory control samples, as well as by initial and continuing calibration of instrumentation following protocols documented in the EGLE Environmental Laboratory Quality Assurance Manual (available from the analytical laboratory). In addition, a semi-quantitative evaluation of laboratory precision will be assessed through the analysis of field blanks.

Field precision, or the ability of the sampling team to collect two samples with a high degree of similarity, will also be assessed by the collection and submission for analysis of field replicate QC samples.

6.2 Accuracy

Accuracy refers to the closeness of a measured value to the actual value and evaluates the bias in a system. Accuracy will be assessed by the laboratory through positive and negative controls following steps described in the EGLE Environmental Laboratory Quality Assurance Manual.

6.3 Representativeness

Representativeness is an expression of the extent to which measured data accurately represents actual conditions. The objective of this sampling effort is to collect samples that accurately represent conditions in the field. Field replicates consisting of two grab samples collected from the same collection bottle and stream location and provide a measure of variability due to actual fluctuations in sampled matrix (e.g., ambient water, wastewater, storm water, etc.) concentrations as well as sample collection and handling.

6.4 Comparability

To maximize the degree of comparability of data generated for this project with previous sampling and analysis program results, sampling locations will, whenever possible, correspond to locations used in the foregoing studies. Sample collection methods, holding times, sample preservation, and laboratory analysis methods will all be conducted in accordance with specified standard methods and protocols. The object is to facilitate observations and conclusions that can be directly compared with historical and/or available background data.

6.5 Sensitivity

Sensitivity is a term broadly applied to the minimum detection capabilities of the specified methods of analysis and instruments used to conduct the scheduled analyses. A Reporting Limit (RL) is the limit of detection for a specific target analyte for a specific sample after any adjustments have been made for dilutions or percent moisture. In contrast, the Method Detection Limit (MDL) is lower than the RL and is a statistical calculation. Typically, reported values between the RL and MDL are flagged by the laboratory; such flagged values indicate that the analyte is present, but the result should be considered an estimate. The EGLE Environmental Laboratory analytical method for the analysis of PFAS in a typical ambient water sample produces a RL of 2.0 ng/L for all analytes listed in **Appendix I**. These limits are sufficient for this project.

6.6 Laboratory Measurement Quality Control Requirements and Acceptability Criteria

Detailed laboratory QC requirements are contained within each individual method and laboratory QA manuals. Lab QC sample results are included with the data report.

6.7 Status Reports and Quality Assurance Reports

A report summarizing the sampling results, quality assurance analysis, and outlining recommended next steps may be produced by EGLE, WRD staff.

7.0 Cost Estimate

The total estimated cost for PFAS sampling in the Pere Marquette Lake and surrounding area is $8,000 (**Table 4**).

8.0 Health and Safety Plan

The prevailing goal of any monitoring undertaken by EGLE, WRD is to have zero incidents/near misses, zero accidents, and cause zero harm to human health or the environment. This goal can be accomplished by creating a culture of safe work practices which include the selection and use of appropriate personal protective equipment (PPE), identifying and communicating potential hazards, remaining attentive to changing conditions and the task at hand, and taking ownership of personal safety and the safety of coworkers.

There are four major categories of hazards that may be associated with the planned sampling activities. These categories are discussed below and include (1) biological hazards, (2) chemical exposures, (3) physical hazards, and (4) behavioral hazards.

(1) Biological hazards include exposure to bacterial and viral diseases in contaminated water or sediments, vector-borne diseases from mosquitos or ticks, and skin rashes or systemic ailments resulting from contact with poisonous plants or animals. These hazards may be mitigated by using appropriate PPE, insect repellents, immunizations, and contact avoidance behaviors.

(2) Chemical hazards include exposure to chemicals in the air, water, or soil/sediment. These hazards may be mitigated by using appropriate PPE (e.g., puncture resistant insoles) and avoidance behaviors.

(3) Physical hazards can be associated with things like vehicular traffic, boating, machinery and tools, fatigue, and weather hazards. Physical hazards can be further subdivided in the following categories:
- Kinetic/mechanical – Slip/trip/fall injuries, falling objects cause struck-by injuries.
- Thermal – Fire, explosions, hot or cold environments cause burns, heat stress, hypothermia.
- Electrical – electrofishing units and overhead/underground power lines. Electrical shock, burns, and fires.
- Acoustic – loud machinery (boat motors, generators) can prevent proper communication and fatigue.
- Radiological – ionizing radiation, UV/IR light or microwaves from equipment/instruments or sunlight.
- Physical hazards can be mitigated by using appropriate PPE and avoidance behaviors.

(4) Behavioral hazards include acting without thinking, planning, or communicating, distracted attention, continuing with an activity when questions or concerns arise, group-think (not exercising freedom of thought, reluctance to ask questions or speak up, assuming someone else will take action), or multi-tasking (cell phone usage while driving, side conversations during a critical action or meeting).

Although a single hazard may not be significant under normal working conditions, combinations of hazards and long working hours, fatigue, or challenging environmental conditions require closer attention to ensure safe work practices. Task-specific hazards should be identified and discussed before work begins at each site (e.g., tailgate meeting). Discussion should include not only potential hazards, but ways in which to prevent, avoid, and mitigate those hazards.

Table 1. Sample locations at and around Occidental Chem Corp, 2025.

Site ID	Sample Type	Latitude	Longitude	PFAS Only	Sample Collection Notes
OcChem-OF1	Regular Sample	43.9403	-86.4422	X	Outfall sample
OcChem-OF1-FR	Field Replicate	43.9403	-86.4422	X	Field replicate of the outfall sample
OcChem-OF1-FD	Field Duplicate	43.9403	-86.4422	X	Field duplicate of the outfall sample
OcChem-CS1	Regular Sample	XX.XXXX	XX.XXXX	X	Sample collected from the facility's composite sampler
FB-AM	Field Blank	NA	NA	X	
OcChem-SW1	Regular Sample	XX.XXXX	XX.XXXX	X	Surface water sample collected north of the discharge point
OcChem-SW2	Regular Sample	XX.XXXX	XX.XXXX	X	Surface water sample near Occidental Chem Corp
OcChem-SW3	Regular Sample	XX.XXXX	XX.XXXX	X	Surface water sample near the South Pond Lagoon System
OcChem-SW4	Regular Sample	XX.XXXX	XX.XXXX	X	Surface water sample on the west side of the Pere Marquette Lake
OcChem-SW5	Regular Sample			X	
OcChem-SW6	Regular Sample			X

Hi Geoff,

Attached is the Occidental Chem Corp and Mosquito Creek sampling results from 3/19/25. Also attached is a summary report (second page has the sample coordinates).

Thanks,
Grace

Hello and thank you for using the EGLE Laboratory.

Environmental laboratory testing for your sampling project, OCCIDENTAL CHEM CORP-GWCU, is complete. Your analytical results for lab work order 2503165 we received on 03/20/2025 are attached.

Contact the EGLE Laboratory Team at 517-335-9800 if you have any questions regarding your environmental laboratory reports.

Thank you,
The EGLE Laboratory Team

Thanks Geoff,

We will add those sample points to our list. The Mosquito Creek samples were requested by Kevin to add to our plan – it sounded like they wanted additional data to assess groundwater impacts to the surface water around the WWTP. I'm looping in Kevin on this in case he has additional information. I appreciate you taking the time to look this over.

Best,

Grace

Subject: RE: Occidental Chem Corp Sampling Plan

Grace,

I would recommend a surface water sample immediately adjacent to the discharge sample OcChem-OF1. I collected a sample adjacent to that outfall (to the north) back in 2022 which came back at 17 ng/L PFOS.

I would also recommend sampling of the unnamed tributary here: -86.422031°ý, 43.934694° (grabbing it from Occidental's property would likely be better if you have access)ý. That location was 8.6 ng/L PFOS in 2022 and had a direct input from the Occidental Property. From the looks of it, it was low lying ditch that received run-off/subsurface flow. There was what appeared to be a holding pond/lagoon of some sort here: -86.422298°ý, 43.935871°ý.

What is the thought behind the Mosquito Creek samples, just a follow-up? I sampled above and below the WWTP, as well as the roadside ditch next to the WWTP, in 2022.

Thanks,

Geoff

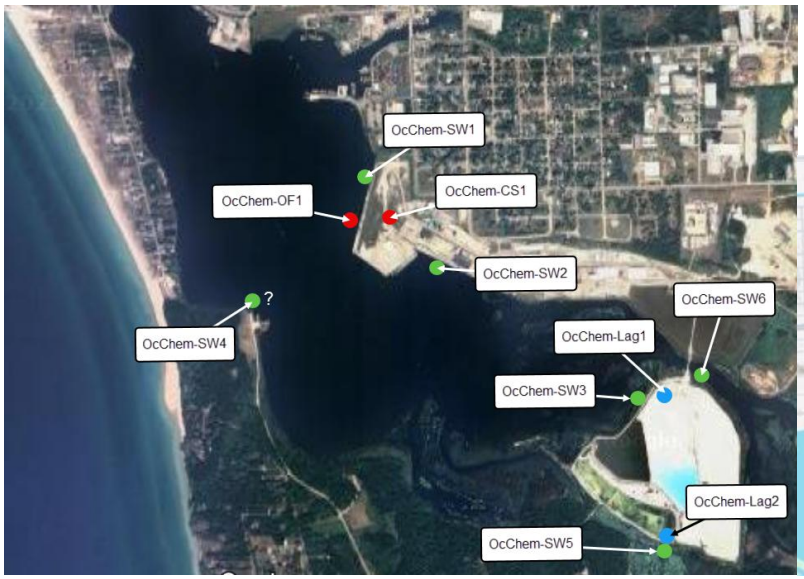
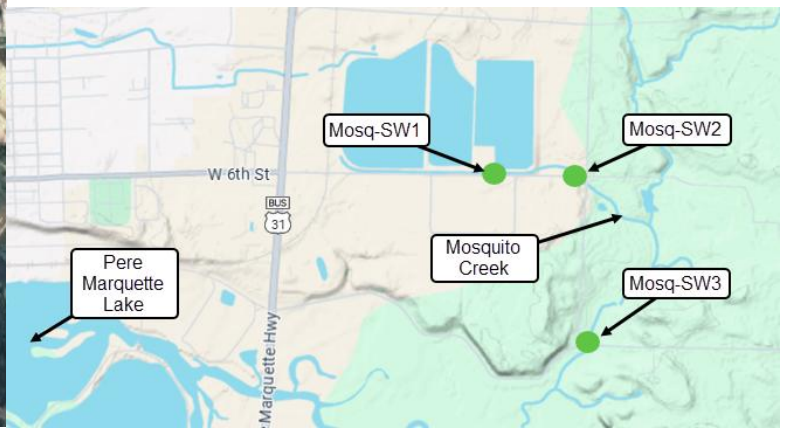
Hi Geoff,

Below is a photo of our proposed sampling locations for Occidental Chem Corp, as well as our draft QAPP. Let us know if you have any suggestions/additional sampling locations you would like us to get.

(Green – surface water, Blue – lagoon, Red – discharge sampling)





Thank you,

Grace

CAS	Analyte
763051-92-9	Perfluoro(2-((8-chlorohexyl)oxy)ethanesulfonic acid) (F-53B Minor)
757124-72-4	4:2 Fluorotelomer sulfonic acid (4:2 FTS)
27619-97-2	6:2 Fluorotelomer sulfonic acid (6:2 FTS)
39108-34-4	8:2 Fluorotelomer sulfonic acid (8:2 FTS)
756426-58-1	Perfluoro(2-((6-chlorohexyl)oxy)ethanesulfonic acid) (F-53B Major)
919005-14-4	4,8-Dioxa-3H-perfluorononanoic acid (ADONA)
13252-13-6	Hexafluoropropylene Oxide Dimer Acid (GenX)
2991-50-6	N-ethyl perfluorooctane sulfonamidoacetic acid (NEtFOSAA)
2355-31-9	N-methyl perfluorooctane sulfonamidoacetic acid (NMeFOSAA)
375-22-4	Perfluorobutanoic acid (PFBA)
375-73-5	Perfluorobutanesulfonic acid (PFBS)
30334-69-1	Perfluorobutanesulfonamide (PFBSA)
335-76-2	Perfluorodecanoic acid (PFDA)
307-55-1	Perfluorododecanoic acid (PFDoA)
335-77-3	Perfluorodecanesulfonic acid (PFDS)
646-83-3	Perfluoroethylcyclohexane sulfonate (PFecHS)
375-85-9	Perfluoroheptanoic acid (PFHpA)
375-92-8	Perfluoroheptanesulfonic Acid (PFHpS)
307-24-4	Perfluorohexanoic acid (PFHxA)
355-46-4	Perfluorohexanesulfonic acid (PFHxS)
41997-13-1	Perfluorohexanesulfonamide (PFHxSA)
375-95-1	Perfluorononanoic acid (PFNA)
68259-12-1	Perfluorononanesulfonic acid (PFNS)
335-67-1	Perfluorooctanoic acid (PFOA)
1763-23-1	Perfluorooctane Sulfonate (PFOS)
754-91-6	Perfluorooctane Sulfonamide (PFOSA)
2706-90-3	Perfluoropentanoic acid (PFPeA)
2706-91-4	Perfluoropentanesulfonic acid (PFPeS)
376-06-7	Perfluorotetradecanoic acid (PFTeA)
72629-94-8	Perfluorotridecanoic Acid (PFTriA)
2058-94-8	Perfluoroundecanoic acid (PFUnA)
763051-92-9	Perfluoro(2-((8-chlorohexyl)oxy)ethanesulfonic acid) (F-53B Minor)
757124-72-4	4:2 Fluorotelomer sulfonic acid (4:2 FTS)
27619-97-2	6:2 Fluorotelomer sulfonic acid (6:2 FTS)
39108-34-4	8:2 Fluorotelomer sulfonic acid (8:2 FTS)
756426-58-1	Perfluoro(2-((6-chlorohexyl)oxy)ethanesulfonic acid) (F-53B Major)
